# THE SOUTHWEST CLUSTER
Network expansion project.

NOTES:

All talk groups are sent from your local repeater to the *Southwest Cluster SERVER*

Slot 2, TG950 is 'relayed' from the server to all the cluster repeaters on exactly the same timeslot and talk group, similar to the way it worked on the original Southwest cluster.

Slot 1 TG9, although also sent to the server, it is not relayed to the other cluster repeaters. So your QSO stays local to your own repeater.

However, The new server system now allows:
Manual dial contacts option on your radio to dial a talk group! This is a way of linking your local repeater to other talk groups both nationally and internationally. Full instructions will appear in due course.
